

ReUse Cloud / A second life, a defensible decision

Compare eligible routes

The workbench evaluates resale, repair and recycling contribution after acquisition credit, logistics and repair risk.

Three fictional assets were inspected in Salesforce. One was already Approved; two were Evaluated. Demo display currency: BRL.

Real authenticated Salesforce capture. Fictional demo data. Screens are unaltered.

Decision policy / Explain the choice, not just the score.

01

Validate inputs

02

Compare routes

03

Evaluate in queue

04

Review and approve

Eligibility before profitability

Resale requires condition ≥ 70 . Repair requires condition ≥ 30 . Recycling is always eligible. Among eligible routes, the engine chooses the greatest unrounded expected contribution.

Costs and repair risk

Base cost = acquisition credit + logistics.

Resale = resale price - base cost.

Recycle = salvage value - base cost.

Repair = probability-weighted proceeds - repair cost - base cost.

Orion 15 / why Recycle?

Condition is 65: resale is ineligible. Resale net is 230, repair expected net is -807.50 and recycling net is -520. Recycling is the better eligible route. The negative result sets the manager-review flag.

Reapproval after changes

Only Evaluated assets can be approved. Role policy enforces approval privileges, including negative-contribution review. Changed financial inputs reset the workflow to Draft for reevaluation.

Observed outcomes / Three assets in one native workbench

The demo result

Atlas 14: Repair, 620, Approved.

Orion 15: Recycle, -520, Evaluated, manager review required.

Lumen 13: Recycle, 50, Evaluated.

Expected contribution shown in the panel: 150. This is a modeled sum, not realized revenue.

Real authenticated Salesforce capture. Fictional demo data. Screens are unaltered.

Native implementation / Technical evidence

15 Apex tests passed

Recorded deployment: Succeeded; 38 components deployed; zero test failures. RecoveryDecisionEngine, RecoveryEvaluationJob and RecoveryAssetTrigger reached 100% coverage in this run. RecoveryController: 85.7%; RecoveryAssetHandler: 90.5%.

The architecture

recoveryWorkbench LWC -> RecoveryController -> RecoveryEvaluationJob -> Recovery_Asset__c.

RecoveryAssetHandler and RecoveryDecisionEngine compute and persist recommendations. Access uses project permission sets, private sharing and user-mode queries.

SOURCE EXCERPT / RecoveryDecisionEngine.cls

```
Decision d = new Decision();
d.resaleNet = a.Resale_Price__c - base;
d.repairNet = (1-a.Failure_Probability__c)*a.Refurbished_Price__c +
a.Failure_Probability__c*a.Salvage_Value__c - a.Repair_Cost__c - base;
d.recycleNet = a.Salvage_Value__c - base;
// Start with the most preferred eligible route. Compare unrounded values.
if (a.Condition_Score__c >= 70) { d.route = 'Resale'; d.expectedNet = d.resaleNet; }
```

Publish two separate cases. Let the evidence lead.

EncoreOps case

Title: EncoreOps | Salesforce Apex & Lightning Event Recovery

Role: Salesforce Developer - Apex, LWC and CRM automation

Skills: Salesforce Development, Apex, Lightning Web

Components, CRM Automation, Software Testing

ReUse Cloud case

Title: ReUse Cloud | Salesforce Apex Recovery Decision App

Role: Salesforce Developer - Apex decision engine and LWC

Skills: Salesforce Development, Apex, Lightning Web

Components, Business Logic, Software Testing

Media order

1. Project cover based on the real platform screen.
2. Edited overview video.
3. Edited workflow explainer.
4. Workflow stills and this project PDF.
5. Link to the separate GitHub source repository.

Evidence and limits

Videos are edited presentations built from real captures and explanatory titles; they are not continuous recordings of every click. EncoreOps holds, confirmation, credit and refund were executed in the UI. ReUse statuses and policy were inspected; its full UI approval sequence is not recorded.

These are independent fictional-data portfolio labs.
